Release Notes for GFZ GRACE-FO Level-2 Products - version RL06

Last update: 19.08.2022

Prepared by: Christoph Dahle, GFZ (email: grace@gfz-potsdam.de)

General Remarks:

- A GFZ GRACE-FO RL06 time series is being routinely processed and is currently available at the two GRACE archives GFZ/ISDC (Information System and Data Centre) and JPL/PO.DAAC (Physical Oceanography Distributed Active Archive Center) for the period from June 2018 through June 2022.
- GRACE-FO RL06 is the initial release of GRACE-FO Level-2 products indicating consistency and continuity with the current GRACE RL06 time series.
- Details on modifications w.r.t. GFZ GRACE RL06 [1] can be found in the GFZ GRACE-FO Level-2 Processing Standards Document for Level-2 Product Release 06 [2] which is also available at the GRACE archives.
- The GRACE-FO RL06 Level-2 filename convention is the same as for GRACE RL06, except for the "mission"-string which is changed from "GRAC" to "GRFO" (see GRACE-FO Level-2 Gravity Field Product User Handbook [3]).
- As for GRACE RL06, a linear mean pole is used during GRACE-FO RL06 Level-2 processing that negates the need for the correction of the $C_{21}$ and $S_{21}$ coefficients recommended by Wahr et al. (2015) [4], which was applicable for GRACE RL05 solutions.
- The following two versions of GFZ GRACE-FO RL06 monthly solutions are provided: (1) up to degree/order 60 and (2) up to degree/order 96 (in case of sufficient satellite ground track coverage).
- The uncertainties of the spherical harmonic coefficients provided with the GFZ GRACE-FO RL06 gravity field solutions have not been calibrated and represent the formal errors.

User Recommendations & Requests:

- **Geocenter:** Consistent with GRACE, GRACE-FO is not sensitive to degree 1 harmonics (geocenter). GRACE/GRACE-FO Technical Note TN-13 [5] contains geocenter estimates using the methods of Swenson et al. (2008) [6] and Sun et al. (2016) [7], and is updated in synch with Level-2 monthly releases. These have been reprocessed for the entire GRACE and GRACE-FO time span to be consistent with the below-mentioned TN-14, so users need to replace the entire TN-13 time series. It is recommended to augment the GRACE and GRACE-FO geocenter with this product for surface mass change estimation.
- **$C_{20}$ coefficient:** Consistent with the GRACE SDS recommendations, GRACE-FO SDS recommends the replacement of the native GRACE-FO $C_{20}$ coefficient with that from SLR. Note that GRACE Technical Note TN-11 will no longer be updated; it is replaced by GRACE/GRACE-FO Technical Note TN-14 [8] and contains both $C_{20}$ and $C_{30}$ estimates derived from SLR using
Level-2 RL06 standards. TN-14 is updated in synch with Level-2 monthly releases. It is recommended to replace the native GRACE and GRACE-FO C_{20} coefficients with this product for all months (April 2002 – current) [9].

- **C_{30} coefficient:** The GRACE-FO SDS has determined that the C_{30} coefficient in GRACE-FO shows comparatively more variability relative to the long-term climatology derived from the GRACE C_{30} coefficient. Therefore, SDS recommends that users assess the impact on regional mass budgets of substituting the GRACE-FO C_{30} coefficient with one derived from SLR (similar to the C_{20} approach). It is recommended to replace the native GRACE and GRACE-FO C_{30} coefficients with the aforementioned Technical Note TN-14 [8] from August 2016 onwards (August 2016 – current) [10].

- **Feedback Request:** The GRACE-FO project SDS is looking for feedback from the Science Team and wider community on the impact of C_{20} and C_{30} replacements, either from these or other candidate SLR time series, on regional mass balances to support the project in further improving the handling of low-degree harmonics in GRACE and GRACE-FO data processing.

**Products:**

There are usually 6 Level-2 product files available for each month where YYYY corresponds to a 4-digit year and DDD corresponds to a 3-digit day of year (for details regarding the product names see the GRACE-FO Level-2 Gravity Field Product User Handbook [3]):

**GSM-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BA01_0600**
Unconstrained monthly gravity field solution estimated up to degree/order 60.

**GSM-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BB01_0600**
Unconstrained monthly gravity field solution estimated up to degree/order 96.
*Note that for months with short-period repeat orbits, this solution might not always be published.*

**GAA-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BC01_0600**
The average of the “atm” coefficients from the AOD1B RL06 product up to degree/order 180 over the same time span as the GSM products.

**GAB-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BC01_0600**
The average of the “ocn” coefficients from the AOD1B RL06 product up to degree/order 180 over the same time span as the GSM products.

**GAC-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BC01_0600**
The average of the “glo” coefficients from the AOD1B RL06 product up to degree/order 180 over the same time span as the GSM products; these harmonic coefficients are used as background model during Level-2 processing.

**GAD-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BC01_0600**
The average of the “oba” coefficients from the AOD1B RL06 product up to degree/order 180 over the same time span as the GSM products.

*Note that the GAA/GAB/GAC/GAD products contain coefficients for degree 0 and 1; however, these coefficients are not used in the GFZ GRACE-FO Level-2 processing.*
Also note that the averaging of the GAA/GAB/GAC/GAD products is computed over entire days, regardless of whether the full day (as opposed to a partial day) was included in Level-2 processing.

For further details about AOD1B see the Product Description Document for AOD1B Release 06 [11].

Additional Level-2 product files (available only at ISDC):

**GSM-2_YYYYDDD-YYYYDDD_GRFO_GFZOP_BB01_0600.snx**

Monthly normal equation of gravity field parameters up to degree/order 96 in SINEX format, available here: ftp://isdcftp.gfz-potsdam.de/grace-fo/Level-2/GFZ/RL06_NEQs_SINEX/

Overview of available solutions:

The following table shows the currently available monthly Level-2 GFZ GRACE-FO RL06 products, where

- **Release Date** is chronologically starting from first provision of GFZ RL06 data till today.
- **Product Name** is in agreement with the Level-2 Gravity Field Product User Handbook [3].
- **Month** is the calendar month the Level-2 products are assigned to (usually one complete month of data is used, exact start and end epochs are provided in the Level-2 product headers).
- **Reference epoch** is the proper mean epoch of the Level-2 products taking into account complete or partial days between start and end epoch which were not used during the generation of the Level-2 products; the reference epoch is given in civilian date and UTC time (rounded to minutes).
- **Arcs & Days** are the number of orbital arcs used for the generation of the Level-2 products and the accumulated number of actual days over these orbital arcs (i.e. the amount of days where GRACE data has been incorporated in the Level-2 processing).
- **Max. d/o** is the maximum degree and order for the corresponding Level-2 product.
- **GAx** is yes, if the corresponding GAA, GAB, GAC and GAD products are available, too (nominal case).
- **Comments**, which are explained in detail further below.

</table>
### Comments:

1) During gravity field estimation for this month, the fully-populated accelerometer scale factor matrix has been estimated once per orbital arc.

2) During gravity field estimation for this month, the fully-populated accelerometer scale factor matrix has been estimated globally once per month.

3) During gravity field estimation for this month, a fully-populated accelerometer scale factor matrix has been estimated once per orbital arc for days when the satellites were in nadir pointing mode, whereas from all other days when the satellites were in relative pointing mode one global fully-populated accelerometer scale factor matrix has been estimated.
